ABSTRACT

This report provides a work form and rationale to perform hand calculations of the radar range equation. The techniques described cover the conventional geometric aspects of the radar equations as well as the effects of rain clutter, rain attenuation, atmospheric attenuation, sea and land clutter, and pulse integration for both conventional pulse and chirp radar. The report is designed to be complete within itself, requiring no further texts, tables, references or slide rules.

	APPENDIX B: MATHEMATICAL DERIVATION.	B-1
	APPENDIX C: WORK FORM USAGE EXAMPLE	C-1

I. INTRODUCTION

In the evaluation of the detection performance of a radar system, it is necessary to use the radar equation in one of its many forms. Unfortunately the mixture of units and the calculation of clutter effects defy convenient manipulation. However, with certain simplifying assumptions and limitations, one can develop equations which can be used conveniently by hand. The calculation techniques in this report cover the effects of rain clutter, rain attenuation, atmospheric attenuation, sea clutter, land clutter and pulse integration as well as the conventional geometric aspects.

The limiting assumptions are: the depression (or elevation) angle must be less than 10° , the slant range must be greater than 3 nautical miles, and the radar and target altitude should be less than 10,000 feet. These limits are imposed by certain geometric simplifications. Fortunately, the majority of radar applications fall well within these limitations.

The goal of this report is to allow an evaluation to be made without further reference to any aids, including charts, tables or slide rule. These techniques were originally developed at NAFI in order to more fully assess a radar design during meetings and conferences.

Other, more general techniques, as well as a more complete discussion of many of the parameters and their effect on a radar system can be found in the following NAFI reports: "Simplified Radar Calculation Techniques" NAFI TR-917, and "Computer Aided Radar Design" NAFI TR-1461.

Most of the calculations in this report use decibels to facilitate division, multiplication and root extractions. Numerous simplified tables are included to estimate integration, attenuation and clutter effects. The major radar parameters calculated include maximum range, integrated signal to noise, signal to weather clutter, signal to land clutter and signal to sea clutter ratio. These ratios may be combined to yield the integrated signal to noise plus weather plus sea or land clutter ratio for any specified range and target.

The calculation of the integrated signal to noise plus clutter ratio is performed in two parts. The first part uses Section A to determine an estimate of the maximum range without any clutter or weather effects. The second part uses Section B to calculate the integrated signal to noise plus clutter ratio with clutter and weather effects at a particular range. Most calculations are in decibels and a foldout decibel to ratio conversion table is given in Appendix A to help the user. Section A and section B are work forms for calculation of maximum range and signal to noise plus clutter ratio, respectively.

Appendix B presents the mathematical derivation of the simplified equations used in sections A and B. Appendix C is an example of the usage of the work forms.

II. CALCULATIONSA. MAXIMUM RANGE ESTIMATION1. Single Pulse

Parameter	Value	Units	db Representation	Multiply By	Add db Results
P _k : Peak Power		KW		+1	
λ : Wavelength		cm		+2	
σ_T : Target RCS		M ²		+1	
G : Antenna Gain	db		→ +2		
L : Losses	db		→ -1		
B : Bandwidth	MHz			-1	
NF _o : Noise Figure	db		→ -1		
(S/N) : Signal/Noise	db		→ -1		
Conversion Factor					→ -30

$$\frac{1}{4} \text{ db nautical miles} = \text{SUM}_{4R} = \text{_____ db}$$

The maximum range (N miles) is obtained by multiplying the SUM_{4R} decibel by $\frac{1}{4}$ and expressing this as a ratio:

$$\text{Maximum Range Estimation} = \text{_____ NM}$$

2. Comments

a. Chirp Systems

- (1). Use peak transmitter power (as at the antenna)
- (2). Use the narrow, unchirped bandwidth

b. Antenna Gain

- (1). If aperture only is given, see table in Appendix A.

NAFI TR-1554

c. Losses

(1). Typical value for search radar 16 db, minimum value 10 db.

(2). Losses included are:

	Minimum db
L_c collapsing	2
L_i integration	1
L_e gate or filter overlap	0
L_g threshold	1
L_d scan distribution	1
L_f target	0
L_n antenna efficiency	0
L_m filter matching	1
L_o post detection integration	1
L_p antenna pattern	1
L_r receiving loss	1
L_t transmitting loss	1
L_s scanning loss	0
	<hr/> 10 db

d. Signal to Noise Ratio (S/N). Typical value: 12db.

This provides a probability of detection of about 90 percent with a false alarm ratio of .0001. For other values see Appendix A.

NAFI TR-1554

e. Noise Figure. The following table gives the minimum noise figures that may be expected from different types of detectors. Actual values that may be expected from equipment in the field exceed these values by about 40 percent.

f. PRF Limited Range

Parameter	Value	Units	db Representation	Multiply By	Add db Results
PRF Conversion Factor		pulses/sec		-1	+49.2db

$$U_{db}, \text{ Unambiguous decibel range} = \text{_____} \text{ db}$$

The PRF limited range is the ratio representation of the Unambiguous decibel range, U_{db} . Therefore, PRF Limited Range = _____ NM

B. CALCULATION OF $\left(\frac{S}{N + C_w + C_{S/L}} \right)_i$ RATIO1. Preliminary Information for $\left(\frac{S}{N + C_w + C_{S/L}} \right)_i$ Calculation

Limitations: Radar height less than 10,000 feet.

Target height less than 10,000 feet.

Depression angles less than 10 degrees.

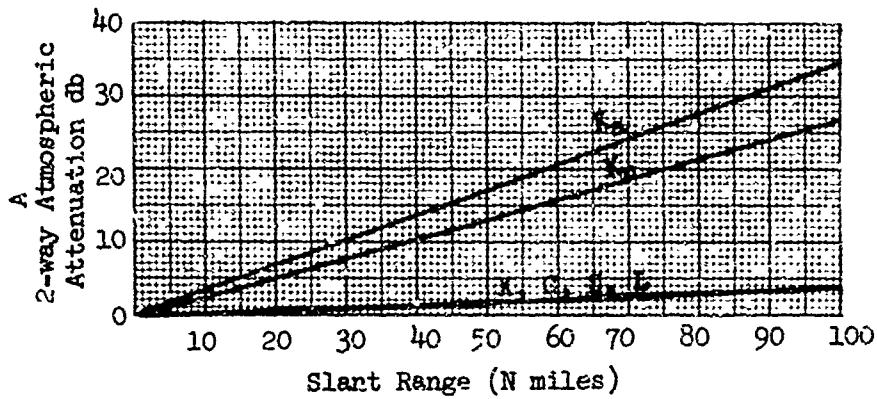

Slant ranges greater than 3 N miles

a. Slant Range, R = _____ n miles

Radar Height, h = _____ (100's feet)

Depression angle, θ° , = $\frac{h \text{ (100's ft)}}{R \text{ (n miles)}}$ = _____ degrees.

b. Atmospheric Attenuation, A = _____ db.

NAFI TR-1554

c. Rain Attenuation

(1)

Parameter	Value	Units	db Representation	Multiply By	Add db Results
R : Range		NM		+1	
W : Rain Rate		mm/hr		+1	
λ : Wavelength Factor		cm		-2	
					-1.42

$$\text{SUM}_R = \text{_____} \text{ db}$$

(2)

Parameter	Value	Units	Ratio Representation	A_R
SUM_R		db		

$$A_R, \text{ 2-way Rain Attenuation} = \text{_____} \text{ db}$$

NAFI TR-1554

2. Calculation of (S/N)₁a. Single Pulse (S/N)₁

Parameter	Value	Units	db Representation	Multiply By	Add db Results
P _K		Kw		+1	
λ		cm		+2	
G _T		M ²		+1	
G		db	→	+2	
L		db	→	-1	
A		db	→	-1	
A _R		db	→	-1	
NF _o		db	→	-1	
B		MHz		-1	
R		NM		-4	
Factor					-30.0

$$\left(\frac{S}{N}\right)_1 = \text{_____} \text{ db}$$

b. Integration Improvement (Assuming visual PPI detection)

PRF = _____ pulses/second

AZ° = _____ degrees

SCAN RATE _____ degrees/second

$$\text{number of Hits/Scan, } \#H = \frac{\text{(PRF)}(\text{AZ}^\circ)}{\text{(SCAN RATE)}} = \text{_____ Hits/Scan}$$

#H, (Hits/Scan) =	5	10	15	20	25	30	40	50	60
I, Integration Improvement in db =	6	8.4	9.6	10.5	11.2	11.8	12.6	13.2	13.8

$$\text{Integration Improvement, I} = \text{_____ db}$$

c. Integrated (S/N)_i

$$\left(\frac{S}{N}\right)_i = \left(\frac{S}{N}\right)_1 (\text{db}) + I \text{db} = \text{_____ db}$$

3. Calculation of $(\frac{S}{C_w})_1$ a. Single Pulse $(S/C_w)_1$

Parameter	Value	Units	db Representation	Multiply By	Add db Results
σ_T : Target RCS		m^2		+1	
λ : Wavelength		cm		+4	
W : Rain Rate		mm/hr		-1.6	
AZ : AZ Beamwidth		deg.		-1	
EL : EL Beamwidth		deg.		-1	
τ : Pulse Length		μ sec		-1	
R : Range		NM		-2	
Factor					+ 4.87 db

$$(S/C_w)_1 = \text{_____} \text{ db}$$

b. Integration Factor

$$\text{Integration Improvement, I, from 2b.} = \text{_____} \text{ db}$$

c. Pulse Compression Ratio

$$\text{Pulse Compression Ratio} = \text{_____} \text{ unitless}$$

The Pulse Compression Factor, CR, is the decibel representation of the unitless Pulse Compression Ratio.

$$\text{Therefore, Pulse Compression Factor, CR} = \text{_____} \text{ db}$$

d. Integrated $(S/C_w)_1$

$$(\frac{S}{C_w})_1 = (\frac{S}{C_w})_{1\text{db}} + I_{\text{db}} + CR_{\text{db}} = \text{_____} \text{ db}$$

NAFI TR-1554

4. Calculate $\left(\frac{S}{C_{S/L}}\right)_i$

a. Clutter Reflectivity

(1). Depression Angle, θ , from la. = _____ deg.

Radar Band = _____

Clutter Type = _____

Clutter Reflectivity, σ_o , from Clutter values Appendix A. = _____ db.

(2). Pulse Compression Effect:

Parameter	Value	Units	Multiply By	Add db Results
σ_o : Clutter Reflectivity		+db	-1	
CR : From Sec. 3c.		+db	-1	

$\sigma_o(\text{EFF})$, Effective Clutter Reflectivity = _____ db.

b. Single Pulse $\left(\frac{S}{C_{S/L}}\right)_1$

Parameter	Value	Units	db Representation	Multiply by	Add db Results
C_T : Target RCS		m^2		+1	
τ : Pulse Length		μsec		-1	
R : Range		NM		-1	
AZ : AZ Beamwidth		deg.		-1	
$\sigma_o(\text{EFF})$: From Sec. 4a.		db	→	-1	
Factor					→ -35.35 db

Single Pulse $\left(\frac{S}{C_{S/L}}\right)_1 =$ _____ db

c. Integrated $(\frac{S}{C_{S/L}})_i$

$$(\frac{S}{C_{S/L}})_1 \text{ (from Sec. 4b.)} = \text{_____ db}$$

$$I \text{ (From Sec. 2b.)} = \text{_____ db}$$

$$(\frac{S}{C_{S/L}})_i = (\frac{S}{C_{S/L}})_1 + I = \text{_____ db}$$

5. Calculate $(\frac{S}{N + C_w + C_{S/L}})_i$

a. Calculate "Energy" Ratio

Parameter	Value	Units	Multiply By	Add Ratio Representation
$(S/N)_i$: Section 2c.		db	-1	
$(S/C_w)_i$: Section 3d.		db	-1	
$(S/C_{S/L})_i$: Section 4c.		db	-1	

$$E, \text{ Inverse "Energy" Ratio} = \text{_____ unitless}$$

b. Integrated $(\frac{S}{N + C_w + C_{S/L}})_i$

Parameter	Value	Units	db Representation	Multiply By	$(\frac{S}{N+C_w+C_{S/L}})_i$, db
E, Sec. 5a.		unitless		-1	

$$(\frac{S}{N + C_w + C_{S/L}})_i = \text{_____ db}$$

NAFI TR-1554

APPENDIX A

SIMPLIFIED RADAR DATA

A. Signal to Noise Ratio VS Probability of Detection

$\left(\frac{S}{N + C_w + C_s} \right)_i$	Probability of Detection	Probability of False Alarm
4 db	99 %

C. ANTENNA CHARACTERISTICS

1. Beamwidth Calculations

a. Azimuth Beamwidth

Parameter	Value	Unit	db Representation	Multiply By	Add db Results
Wavelength		cm		+1	
Antenna Width		ft		-1	
Conversion Factor				→	+4.3 db

Decibel Antenna Beamwidth, AZ_{db} = _____ db

b. Elevation Beamwidth

Parameter	Value	Unit	db Representation	Multiply By	Add db Results
Wavelength		cm		+1	
Antenna Height		ft		-1	
Conversion Factor				→	+4.3 db

Decibel Antenna Beamwidth, EL_{db} = _____ db

The antenna beamwidths in degrees are the ratio representation of the decibel antenna beamwidth. Therefore,

$$AZ^\circ = \text{_____ degrees}$$

$$EL^\circ = \text{_____ degrees}$$

2. Antenna Gain Calculation

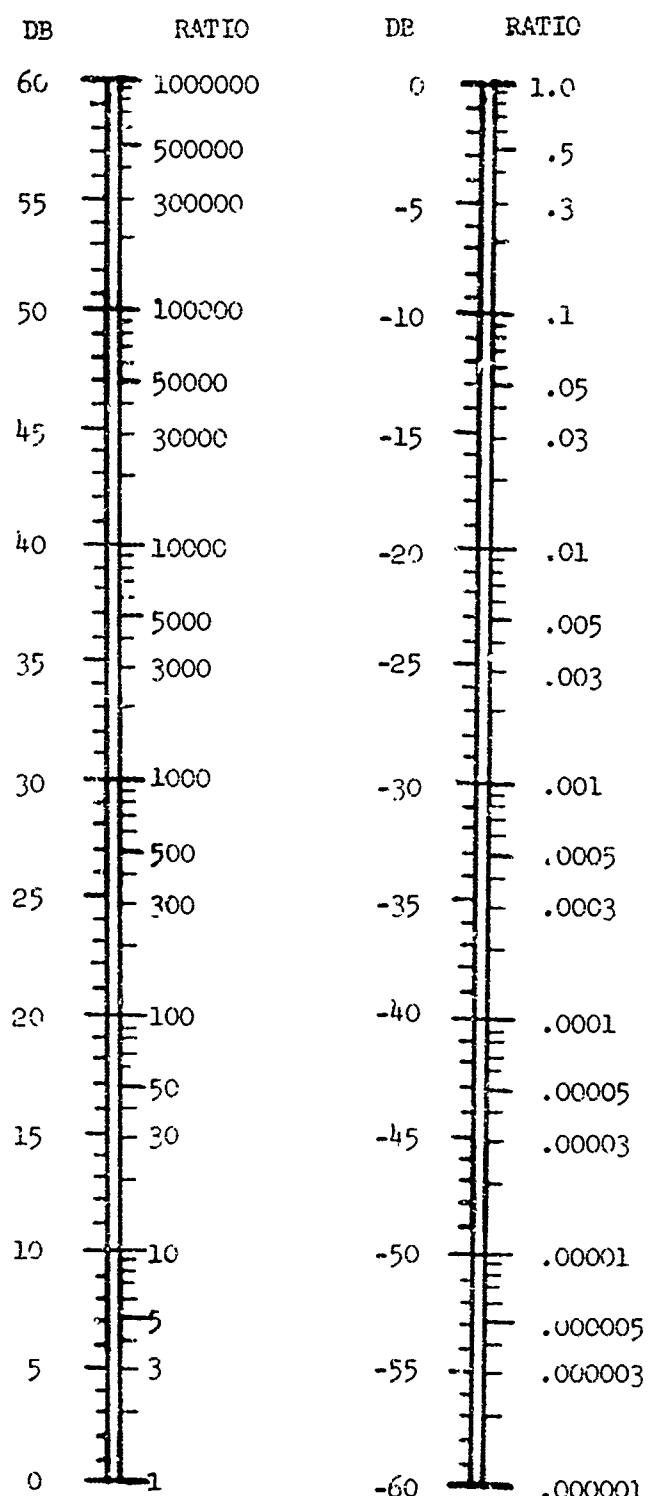

Parameter	Value	Units	db Representation	Multiply By	Add db Results
AZ°		deg.		-1	
EL°		deg.		-1	
Conversion Factor				→	+44.3db

Antenna Gain, G = _____ db

D. DECIBEL TO RATIO CONVERSION TABLE

NAFI TR-1554

A-4

B

APPENDIX B

SIMPLIFIED MATHEMATICAL DERIVATION FOR ($\frac{S}{N + C_w + C_{S/L}}$) i

The derivation of the equations used in this report are in NAFI TR-1461. The decibel equation form used is as given in NAFI TR-917. The following derivations are a summary of some of the equations in these two reports.

A. SINGLE PULSE SIGNAL TO NOISE RATIO

$$\left(\frac{S}{N}\right)_1 = \left(\frac{P\lambda^2}{BR^4}\right) \sigma_T 10^{(2G - L - A_R - \overline{NF}_o)/10} \times 10^3 \quad (B.1)$$

where

- S = Signal Power Watts
- N = Noise Power Watts
- P = Peak Power, kw
- λ = Wavelength, cm
- σ_T = Target RCS, M^2
- B = IF Noise Bandwidth, MHz
- R = Slant Range, NM
- G = Antenna Gain, db
- L = System Losses, db
- A_R = Rain Losses, db
- A = Atmospheric Attenuation, db
- \overline{NF}_o = Noise Figure, db

B. WEATHER CLUTTER BACKSCATTER

$$\sigma_w = \frac{\pi^{1.6} \text{AZ}^\circ \text{EL}^\circ R^2}{4\lambda} \cdot 32549 (M^2)$$

$$\left(\frac{C_w}{N}\right)_1 = \left(\frac{S}{N}\right)_1 \frac{\sigma_w}{\sigma_T}$$

therefore

$$\left(\frac{S}{C_w}\right)_1 = \frac{\sigma_T}{\sigma_w}$$

Therefore, signal to weather clutter ratio:

$$\left(\frac{S}{C_w}\right)_1 = \frac{\sigma_T \lambda^4}{W^{1.6} AZ^\circ EL^\circ R^2 \tau} 3.072 \quad (B.2)$$

where:

- C_w = Weather clutter backscatter power, watts
- σ_w = Weather clutter reflective area, M^2
- W = Rain Rate, MM/Hour
- AZ° = Antenna azimuth beamwidth, degrees
- EL° = Antenna elevation beamwidth, degrees
- τ = Pulse length, μ seconds

C. SEA OR LAND CLUTTER RETURN

$$\sigma_{S/L} = \frac{AZ^\circ R \tau}{\cos E} 3427.1 10^{(\sigma_0/10)} (M^2)$$

Assume: pulse width limited clutter

Assume: depression angle, E , is less than 10° so $\cos E = 1$

Therefore,

$$\sigma_{S/L} = AZ^\circ R \tau 10^{(\sigma_0/10)} 3427.1 M^2$$

$$\left(\frac{S}{C_{S/L}} \right) = \frac{\sigma_T}{\sigma_{S/L}}$$

$$\left(\frac{S}{C_{S/L}} \right) = \frac{\sigma_T}{AZ^\circ R \tau} 10^{\frac{2.917 \times 10^{-4}}{(\sigma_o/10)}} \quad (B.3)$$

where

$\sigma_{S/L}$ = Sea or land clutter area, m^2

σ_o = Clutter reflectivity, db_m

E = Depression angle, degrees

$C_{S/L}$ = Sea or land clutter return, watts

D. INTEGRATED $\left(\frac{S}{N + C_w + C_{S/L}} \right)_i RATIO$

$$\left(\frac{S}{N + C_w + C_{S/L}} \right)_i = 10 \log \left(\frac{S}{N + C_w + C_{S/L}} \right) + I(\text{in } db)$$

where: I = Integration Improvement, db

Let: I_F = Integration Improvement Ratio = $10^{(I/10)}$, unitless

Derivation: Using Equations (B.1), (B.2) and (B.3), the integrated signal to noise plus weather clutter plus sea or land clutter ratio may be written as:

$$\frac{S}{N + C_w + C_{S/L}} = \frac{1}{\frac{N}{S} + \frac{C_w}{S} + \frac{C_{S/L}}{S}}$$

NAFI TR-1554

$$\frac{S}{N + C_w + C_{S/L}} = \frac{1}{\left(\frac{S}{N}\right)} + \frac{1}{\left(\frac{S}{C_w}\right)} + \frac{1}{\left(\frac{S}{C_{S/L}}\right)}$$

The equation as used in this report is:

$$\left(\frac{S}{N + C_w + C_{S/L}} \right)_j = 10 \log \left[\frac{1}{\left(\frac{S \cdot I_F}{N} \right)} + \frac{1}{\left(\frac{S \cdot I_F}{C_w} \right)} + \frac{1}{\left(\frac{S \cdot I_F}{C_{S/L}} \right)} \right]$$

E. DEPRESSION ANGLE APPROXIMATION

R = Slant Range, N miles

h = Height, 100's feet

E° = Depression Angle, degrees

therefore

$$R \sin E^\circ = \frac{h}{60.8}$$

$$\text{let } \sin E^\circ = E \text{ (Rad.)}$$

therefore

$$E \text{ (Rad)} = \frac{h}{R \cdot 60.8} \text{ (Rad)}$$

$$E \text{ (deg)} = E^c = \frac{h}{R \cdot 60.8} \cdot \frac{360^\circ}{2\pi \text{ Rad}}$$

$$E^\circ = \frac{h}{R} \cdot 942$$

therefore

$$E^\circ \approx \frac{h \text{ (100's feet)}}{R \text{ (N miles)}} \text{ in degrees}$$

NAFI TR-1554

APPENDIX C

WORK FORM USAGE EXAMPLE

This is an example of usage of the work forms presented in sections A and B. The calculations are for the performance of a radar which has the following characteristics.

RADAR PARAMETERS

P: 50 kw
L: 13 db
 \overline{NF}_o : 10 db
 λ : 3.22 cm (X band)
Rain: 1mm/hour
Antenna: AZ = 2°, EL = 2°, Gain = 38 db
 T : 1 μ sec
B: 1 MHz
PRF: 1000 pulses/sec
Scan Rate: 90°/sec
Target RCS: 1000 m^2
Radar
Height: 6,000 feet
Target
Height: 0 feet
Clutter: sea state 3
Desired Pd: 90% at PFA = 10^{-4}

III. CALCULATIONSA. MAXIMUM RANGE ESTIMATION1. Single Pulse

Parameter	Value	Units	db Representation	Multiply By	Add db Results
P _k : Peak Power	50	KW	17 db	+1	+17 db
λ : Wavelength	3.22	cm	5.1db	+2	+10.2db
σ _T : Target RCS	1000	m ²	30 db	+1	+30db
G : Antenna Gain	38	db		+2	+76db
L : Losses	13	db		-1	-13db
B : Bandwidth	1	MHz	0 db	-1	-0db
MF _o : Noise Figure	10	db		-1	-10db
(S/N) : Signal/Noise Conversion Factor	16	db		-1	-16db
					-30

$$\frac{1}{4} \text{ db nautical miles} = \text{SUM}_{4R} = 64.2 \text{ db}$$

The maximum range (N miles) is obtained by multiplying the SUM_{4R} decibel by $\frac{1}{4}$ and expressing this as a ratio:

$$\text{Maximum Range Estimation} = \underline{40} \text{ NM}$$

2. Commentsa. Chirp Systems

- (1). Use peak transmitter power (as at the antenna)
- (2). Use the narrow, unchirped bandwidth

b. Antenna Gain

- (1). If aperture only is given, see table in Appendix A.

NAFI TR-1554

c. Losses

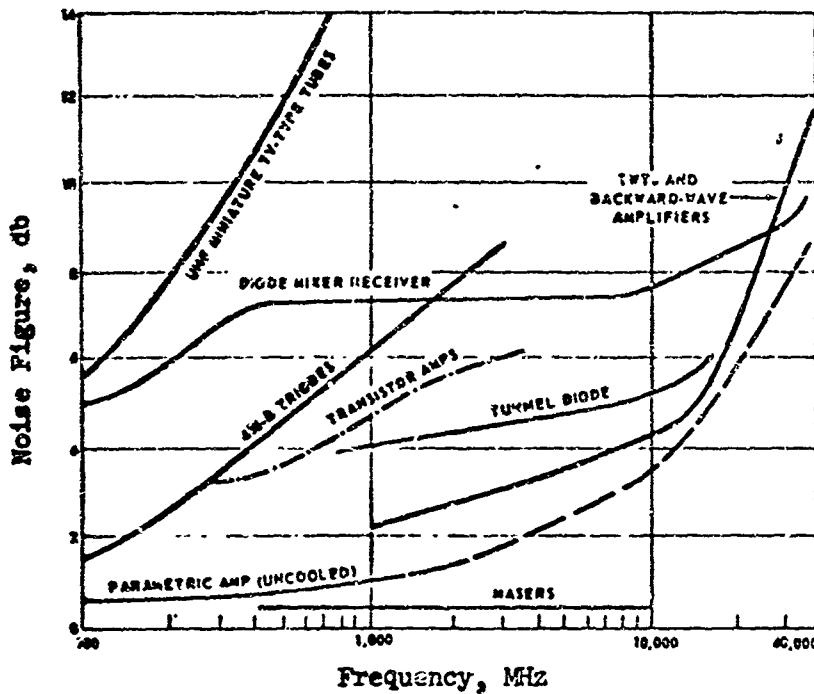

- (1). Typical value for search radar 16 db, minimum value 10 db.
- (2). Losses included are:

	Minimum db
L_c collapsing	2
L_i integration	1
L_e gate or filter overlap	0
L_g threshold	1
L_d scan distribution	1
L_t target	0
L_n antenna efficiency	0
L_m filter matching	1
L_o post detection integration	1
L_p antenna pattern	1
L_r receiving loss	1
L_t transmitting loss	1
L_s scanning loss	0
	<hr/> 10 db

d. Signal to Noise Ratio (S/N). Typical value: 12db.. This provides a probability of detection of about 90 percent with a false alarm ratio of .0001. For other values see Appendix A.

HAFI TR-1554

e. Noise Figure. The following table gives the minimum noise figures that may be expected from different types of detectors. Actual values that may be expected from equipment in the field exceed these values by about 40 percent.

f. PRF Limited Range

Parameter	Value	Units	db Representation	Multiply By	Add db Results
PRF Conversion Factor	1500 pulses/sec		31.5 db	-1	-31.5 db +49.2 db

$$U_{\text{db}}, \text{ Unambiguous decibel range} = +17.2 \text{ db}$$

The PRF limited range is the ratio representation of the Unambiguous decibel range, U_{db} . Therefore, PRF Limited Range = 60 NM

B. CALCULATION OF $\left(\frac{S}{N + C_w + C_{S/L}} \right)_i$ RATIO

1. Preliminary Information for $\left(\frac{S}{N + C_w + C_{S/L}} \right)_i$ Calculation

Limitations: Radar height less than 10,000 feet.

Target height less than 10,000 feet.

Depression angles less than 10 degrees.

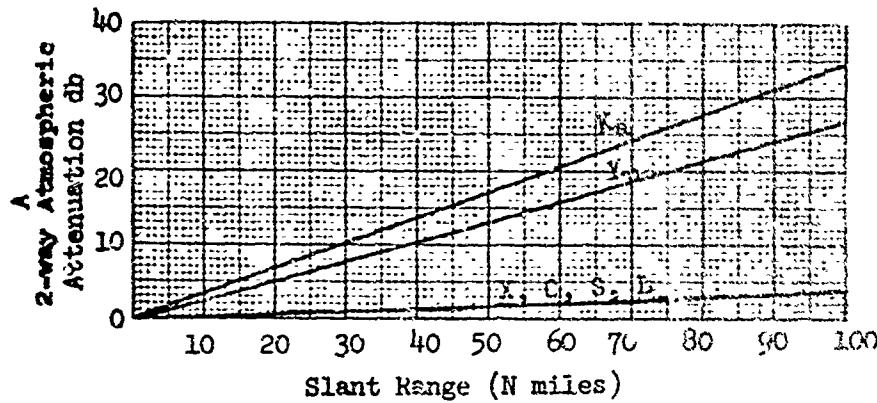

Slant ranges greater than 3 N miles

a. Slant Range, R = 40 n miles

Radar Height, h = 60 (100's feet)

$$\text{Depression angle, } \theta^\circ, = \frac{h \text{ (100's ft)}}{R \text{ (n miles)}} = \underline{1.5} \text{ degrees.}$$

b. Atmospheric Attenuation, A = 1.0 db.

NAFI TR-1554

c. Rain Attenuation

(1)

Parameter	Value	Units	db Representation	Multiply By	Add db Results
R : Range	40	NM	16 db	+1	+16 db
W : Rain Rate	1	mm/hr	0 db	+1	0 db
λ : Wavelength Factor	3.22	cm	5.1 db	-2	-10.2 db
					-1.42

$$\text{SUM}_R = \underline{4.4} \text{ db}$$

(2)

Parameter	Value	Units	Ratio Representation	A_R
SUM_R	4.4	db	2.8	2.8

$$A_R, \text{ 2-way Rain Attenuation} = \underline{2.8} \text{ db}$$

NAFI TR-1554

2. Calculation of (S/N)₁

a. Single Pulse (S/N)₁

Parameter	Value	Units	db Representation	Multiply By	Add db Results
P _K : Peak Power	50	kW	17 db	+1	+17 db
λ : Wavelength	3.22	cm	5.1 db	+2	+10.2 db
σ _T : Target RCS	1000	m ²	30 db	+1	+30 db
G : Antenna Gain	38	db		+2	+76 db
L : Losses	13	db		-1	-13 db
A : Atmospheric Attenuation	1	db		-1	-1 db
A _R : Rain Attenuation	2.8	db		-1	-2.8 db
MF _o : Noise Figure	10	db		-1	-10 db
B : IF Bandwidth	1	MHz	0 db	-1	-0 db
R : Range	40	NM	16 db	-4	-64 db
Factor					-30.0 db

$$(\frac{S}{N})_1 = 12.4 \text{ db}$$

b. Integration Improvement (Assuming visual PPI detection)

PRF = 1500 pulses/second

AZ° = 2 degrees

SCAN RATE 90 degrees/second

$$\text{number of Hits/Scan, } \#H = \frac{(\text{PRF})(\text{AZ}^\circ)}{(\text{SCAN RATE})} = 33 \text{ Hits/Scan}$$

#H, (Hits/Scan) =	5	10	15	20	25	30	40	50	60
I, Integration Improvement in db =	6	8.4	9.6	10.5	11.2	11.8	12.6	13.2	13.8

$$\text{Integration Improvement, I} = 12 \text{ db}$$

c. Integrated (S/N)₁

$$(\frac{S}{N})_1 = (\frac{S}{N})_1 (\text{db}) + I \text{db} = 24.4 \text{ db}$$

3. Calculation of $(\frac{S}{C_w})_1$ a. Single Pulse $(S/C_w)_1$

Parameter	Value	Units	db Representation	Multiply By	Add db Results
σ_T : Target RCS	1000	m^2	30 db	+1	+30 db
λ : Wavelength	3.22	cm	5.1 db	+4	+20.4 db
W : Rain Rate	1	mm/hr	0 db	-1.6	-0 db
AZ : AZ Beamwidth	2	deg.	3 db	-1	-3 db
EL : EL Beamwidth	2	deg.	3 db	-1	-3 db
τ : Pulse Length	1	μ sec	0 db	-1	-0 db
R : Range	40	NM	16 db	-2	-32 db
Factor —					+4.87 db

$$(S/C_w)_1 = -17.3 \text{ db}$$

b. Integration Factor

$$\text{Integration Improvement, I, from 2b.} = 12 \text{ db}$$

c. Pulse Compression Ratio

$$\text{Pulse Compression Ratio} = 1 \text{ unitless}$$

The Pulse Compression Factor, CR, is the decibel representation of the unitless Pulse Compression Ratio.

$$\text{Therefore, Pulse Compression Factor, CR} = 0 \text{ db}$$

d. Integrated $(S/C_w)_1$

$$(\frac{S}{C_w})_1 = (\frac{S}{C_w})_{1\text{db}} + I_{\text{db}} + CR_{\text{db}} = 29.3 \text{ db}$$

NAFI TR-1554

4. Calculate $\left(\frac{S}{C_{S/L}}\right)_i$

a. Clutter Reflectivity

(1). Depression Angle, θ , from la. = 1.5 deg.

Radar Band = X

Clutter Type = S.S.3

Clutter Reflectivity, σ_0 , from Clutter values Appendix A. = 39 db.

(2). Pulse Compression Effect:

Parameter	Value	Units	Multiply By	Add db Results
σ_0 : Clutter Reflectivity	<u>39</u>	+db	-1	<u>-39</u>
CR : From Sec. Sc.	<u>0</u>	+db	-1	<u>-0</u>

σ_0 (EFF), Effective Clutter Reflectivity = -39 db.

b. Single Pulse $\left(\frac{S}{C_{S/L}}\right)_1$

Parameter	Value	Units	db Representation	Multiply by	Add db Results
σ_T : Target RCS	<u>1000</u>	m^2	<u>30 db</u>	+1	<u>+30 db</u>
τ : Pulse Length	<u>1</u>	μsec	<u>0 db</u>	-1	<u>-0 db</u>
R : Range	<u>40</u>	NM	<u>16 db</u>	-1	<u>-16 db</u>
AZ : AZ Beamwidth	<u>2</u>	deg.	<u>3 db</u>	-1	<u>-3 db</u>
σ_0 (EFF) : From Sec. 4a.	<u>-39</u>	db		-1	<u>+39 db</u>
Factor					<u>-35.35 db</u>

Single Pulse $\left(\frac{S}{C_{S/L}}\right)_1 = \underline{14.6}$ db

NAFI TR-1554

c. Integrated $(\frac{S}{C_{S/L}})_i$

$$(\frac{S}{C_{S/L}})_i \text{ (from Sec. 4b.)} = \underline{14.6} \text{ db}$$

$$I \text{ (From Sec. 2b.)} = \underline{12} \text{ db}$$

$$(\frac{S}{C_{S/L}})_i = (\frac{S}{C_{S/L}})_i + I = \underline{26.6} \text{ db}$$

5. Calculate $(\frac{S}{N + C_w + C_{S/L}})_i$

a. Calculate "Energy" Ratio

Parameter	Value	Units	Multiply By	Add Ratio Representation
$(S/N)_i$: Section 2c.	<u>24.4</u>	db	-1	.0035
$(S/C_w)_i$: Section 3d.	<u>29.3</u>	db	-1	.0015
$(S/C_{S/L})_i$: Section 4c.	<u>26.6</u>	db	-1	.0025

$$E, \text{ Inverse "Energy" Ratio} = \underline{.0025} \text{ unitless}$$

b. Integrated $(\frac{S}{N + C_w + C_{S/L}})_i$

Parameter	Value	Units	db Representation	Multiply By	$(\frac{S}{N+C_w+C_{S/L}})_i$ db
E, Sec. 5a.	<u>.0025</u>	unitless	<u>-21.3 db</u>	-1	<u>+21.3 db</u>

$$(\frac{S}{N + C_w + C_{S/L}})_i = \underline{+21.3} \text{ db}$$

DOCUMENT CONTROL DATA - R&D

10. AVAILABILITY/LIMITATION NOTICES This document is subject to special export controls and each transmittal to foreign governments or foreign nationals may be made only with prior approval of Naval Avionics Facility, Indianapolis.		
11. SUPPLEMENTARY NOTES	12. SPONSORING MILITARY ACTIVITY	
13. ABSTRACT This report provides a work form and rationale to perform hand calculations of the radar range equation. The techniques described cover the conventional geometric aspects of the radar equations as well as the effects of rain clutter, rain attenuation, atmospheric attenuation, sea and land clutter, and pulse integration for both conventional pulse and chirp clutter. It is complete, requiring no further texts, tables, references or slide rules.
